

What do you want them to do?

The Nuclear Regulatory Commission needs to begin developing regulations that will govern the operation of the next generation of nuclear power plants.

These advanced nuclear reactors could provide the carbon free energy we need to address climate change issues.

Why should they want to do it?

Why does your research support this?

However, the NRC has not even begun to think about safety and licensing of these power plants. My research group has developed tools and safety analysis that could be a valuable input to this process.

We need to start this work now if we'll be able to start building and operating safe advanced nuclear power plants in the next decade.

What will happen if they act?
